Lab 2 Reflection Report – Agile Backlog & Sprint Simulation

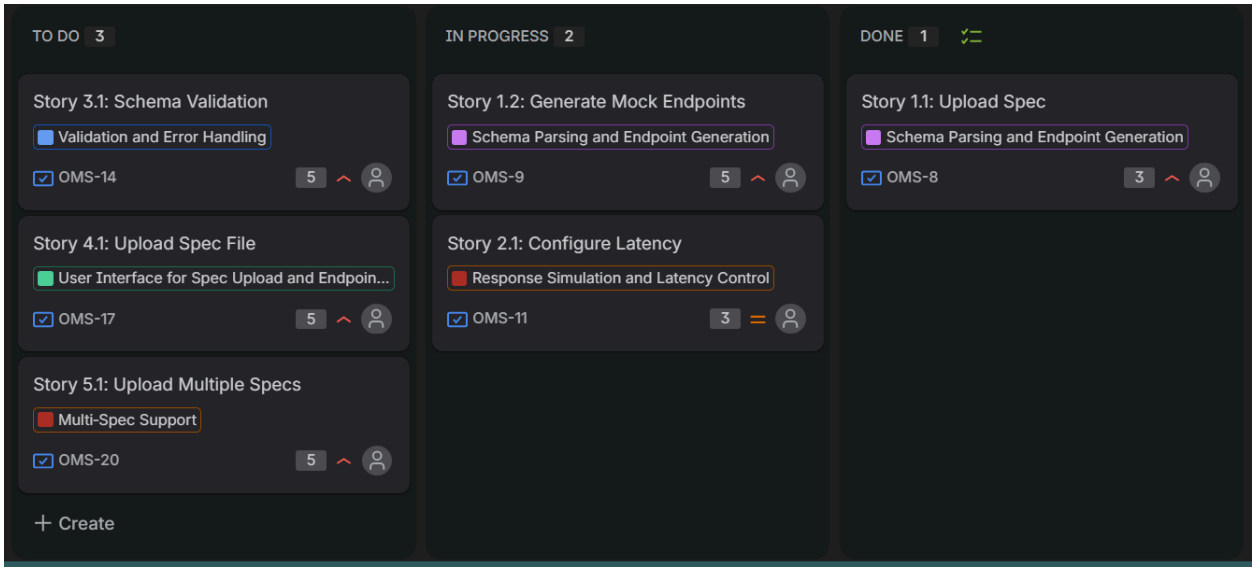

Backlog

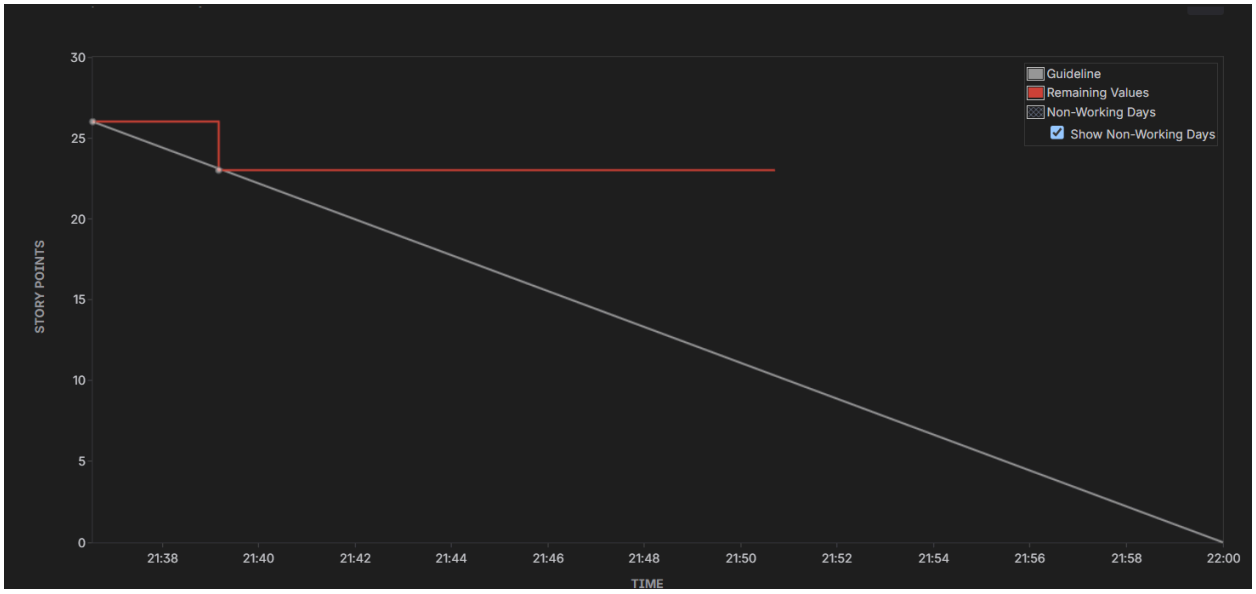

Schema Planning

Active Schema

Burndown Report

Q1: Did your estimations reflect the actual effort?

Yes. Assigning Story Points using the Fibonacci sequence gave a realistic sense of complexity. In Sprint 1, the mix of 3-point and 5-point Stories matched the actual effort needed, and the burndown chart confirmed that progress aligned with those estimates.

Q2: Was your backlog well-prioritized?

Yes. Stories were prioritized by business value and user impact. High-priority items like “Upload Spec” and “Schema Validation” were scheduled first, while lower-priority enhancements were left for later sprints. This ensured Sprint 1 focused on core functionality.

Q3: How did your simulated sprint align with your plan?

The sprint aligned closely with the plan. Selected Stories moved across To Do → In Progress → Done as expected, showing realistic workflow. The Sprint Board reflected balanced progress across Epics, demonstrating that the sprint plan was achievable.

Q4: What insights did the burndown chart give about your team’s capacity?

The burndown chart showed that while initial progress was made, work slowed mid-sprint. This highlighted the importance of pacing and balancing workload. It suggested the team’s capacity was close to the planned velocity but required steady effort to maintain.
